

Nora Patel

Junior backend developer

SYNTHETIC DEMO MATERIAL | All people, projects and results are fictional.

Profile

Python developer with two fictional coursework projects using FastAPI, PostgreSQL and pytest. Interested in reliable APIs, concurrency and clear technical explanations.

Skills

Python, FastAPI, PostgreSQL, SQL, REST APIs, Git, Docker, pytest and basic CI.

Campus event registration API

Designed event creation, seat reservation and cancellation endpoints. Used a transaction, row locking and a uniqueness constraint to prevent overselling and duplicate registrations.

Tested 40 simultaneous requests for the final five seats. Exactly five bookings succeeded in the synthetic test. Added an idempotency key to safely replay a timed-out request.

Compared a database lock with an application-only availability check. Documented the consistency benefit and the risk of long transactions.

Library search project

Loaded 10,000 generated book records. Added a composite index after inspecting a query plan. Median search time changed from 140 ms to 48 ms across 100 local runs; this is a fictional benchmark, not production evidence.

Added pagination tests and recorded the dataset, machine assumptions and limitations of the measurement.

Collaboration

Worked with two fictional teammates. Compared API error formats in code review, agreed on a shared response schema and added examples to the project README.

Learning background

Fictional computer science coursework in databases, data structures and software engineering. No commercial work history is claimed.
